

A facsimile apparatus which is easy to use is provided. Control is performed so that a CPU (central processing unit) registers a sub-address signal and a communication specification so as to correspond to a memory box, selects start of ring-type multiple-address transmission, and selects transfer of ring-type multiple-address reception. When start of ring-type multiple-address transmission has been selected, transmitter information is added. When transferring ring-type multiple-address reception, transmitter information is not added.
